I

II

AB A practical and selective method for the synthesis of the .beta.-arylamines I [R = H, OH (cis and trans); R1 = H, MeO] is reported. The reaction sequence starts from .alpha.-tetralones which readily react with dibenzyl azodicarboxylate to afford the protected .alpha.-hydrazino ketones. Then, depending on the redn. conditions, the trans- or cis-hydrazino alcs. are formed predominantly. The stereoselectivities which range between 18:1 and 1:67 (trans/cis) are explained by stereoelectronic effects and steric hindrance. Depending on the workup procedure, the cis-hydrazino alcs. or the oxazolidinone derivs. II are isolated. Subsequent hydrogenolyses of the hydrazino alcs. lead to the target mols. I.

AB A mild and efficient method for the construction of .beta.-aryl amines from the corresponding .alpha.-aryl ketones is presented. The key steps of the synthesis involve an electrophilic amination by dibenzyl azodicarboxylate followed by a stereoselective LiHBet<sub>3</sub> redn. The reaction sequence is applied to the synthesis of the tricyclic ergoline analog I.

AB Dialkyl azodiformates form dihydrooxadiazines with indene, dihydro-1,4-dioxine, vinylene carbonate, cis- and trans-1,2-dimethoxyethylene, and vinyl acetate by 1,4 addn.; 1,2 addn. yielding diazetidines is observed with vinyl ethers. Diazetidines also result from the addn. of 4-phenyl-.DELTA.1-1,2,4-triazoline-3,5-dione to indene and dihydro-1,4-dioxine. Dihydrooxadiazines are formed in a concerted Diels-Alder reaction with inverse electron demand, the diazetidines via dipolar intermediates. The acceleration of azodiformate addn. by illumination is due to the photo chem. production of cis azodiformates, which show increased thermal reaction rates as compared with the trans isomers.

AB It was shown by chem. degradations that the structure of the adduct of  
indene and diethyl azodiformate is correctly formulated as an oxadiazine.  
The stereochem. structure assigned to a 2-amino-1-indanol by  
interpretation of NMR data (W. E. Rosen, L. Dorfman, and M. P. Linfield,  
1964) was erroneous. The generalizations proposed to deduce the  
stereochemistry of 1,2-disubstituted indan on the basis of NMR spectra  
were an oversimplification.
